NETWORK

Solana Devnet

Freelance work still depends too much on trust.

FOR COMPANIES

- Too much time spent choosing workers
- Quality is uncertain until after delivery

FOR WORKERS

- Payment can depend on the client's subjective decision
- Completed work does not always mean guaranteed payment

Both sides lose when trust is the product

Pico

We remove subjective decisions from both sides.

- Companies do not manually search for workers.
- Workers do not depend only on the client to approve payment.

Every task is funded before anyone starts working.

Company deposits USDC into its **General Balance**. For every task, the platform locks Worker Reward + Verifier Reward.

\$200

WORKER

\$10

VERIFIER

\$210

LOCKED

Only then is the task distributed.

No applications. No portfolios. No manual selection.

- The platform sends the task to workers with the required verified skill.
- Interested workers take a short task-specific qualification test generated by the platform.
- The first qualified worker gets the task.

The client is not the only person deciding payment.

After submission, an independent verified specialist checks the work against predefined Acceptance Criteria.

PASS

Worker gets paid from locked escrow.

NEEDS REVISION

Worker fixes and resubmits.

The verifier is paid for the review itself — not for choosing a specific verdict.

Solana makes the payment logic programmable.

SMART CONTRACTS MANAGE

- Escrow lock before work
- Payment release on PASS
- Verifier reward
- Transparent settlement

WHY IT FITS

USDC funds are locked before work begins. Fast transactions and low fees make this suitable for task-based payments.

We earn when companies fund work.

PRIMARY REVENUE

Platform fee on General Balance deposits.

FUTURE REVENUE

Yield from unused liquidity through crypto lending.

The result is a platform where **companies spend less time hiring, workers know the money already exists, and payment depends on verified work.**
