

PICO

BLOCKCHAIN HACK KRAKÓW · COLOSSEUM

Give your AI a budget, not your wallet.

A payment layer for on-demand AI on Solana.
Prepaid USDC · pay per tool call · hard spend ceiling.

TEAM

1 eng + 1 design · Kraków

NETWORK

Solana Devnet

Agents need to spend. Humans won't hand over the wallet.

- Subscriptions waste money on idle capacity — then cap you mid-run.
- Builders juggle 6–8 prepaid API balances; one dies at 2am → pipeline fails.
- Agents can't do Stripe / KYC. Full wallet access is a non-starter.

First users: Solana builders & traders who use AI in bursts.

TODAY

People who need Explain Tx / Token Check occasionally — not another \$20/mo chat stack.

NEXT

Agent runtimes that need a hard USDC ceiling: deposit once, meter every tool call, withdraw the rest.

Prepaid USDC vault + metered debit per tool call.

Like a prepaid café card: top up, spend per coffee, always see the balance, close the tab anytime.

Payment UX for AI is still subscriptions & API keys.

- **Why now:** agent economy + Solana micropayments (x402 narrative). \$0.01–\$0.05 fees finally work.
- **Why us:** fast loop — custom escrow → live meter → useful Solana tools.
- **Why Solana:** only cheap rails make pay-per-call viable; Anchor program proves it's not a Stripe wrapper.

\$0.01 tool calls only work on cheap rails.

ON-CHAIN

- Custom Anchor program *pico*
- Config + Budget PDAs
- USDC vault · operator debit
- User withdraw_remaining

AUDITABLE SPEND

Every tool call lands as an on-chain debit with tool_id — not a hidden SaaS invoice.

Live on Devnet — two paid tools today.

EXPLAIN TX · \$0.01

Paste a signature → Gemini explains what happened
→ operator debit on success.

TOKEN CHECK · \$0.05

Paste a mint → risk signal → metered spend from the
same budget vault.

hackatonpico.vercel.app/app

Analyze first. Debit only if the tool succeeds.

Human sets the ceiling. Agent (or UI) spends inside it. Leftover USDC withdraws back to the user.

Built end-to-end for the hackathon sprint.

On-chain

OpenRouter meters APIs. We meter a budget humans trust.

CROWDED

Pay-per-AI aggregators · x402 HTTP gateways · subscription wrappers.

PICO WEDGE

On-chain spend vault + hard ceiling UX + Solana-native tools (tx / token) as the first catalog.

Compatible with the x402 narrative — we demo the control layer users actually touch.

Working product — not a slideware MVP.

- Custom Anchor program live on Devnet (deposit / debit / withdraw).
- Web app shipped: landing + /app with Phantom + live meter.
- Two Gemini tools charging on-chain after successful analysis.
- Production URL on Vercel · public GitHub repo.

Try the demo. Help us put more tools on the same budget.

NOW

Win KRK · submit Colosseum · collect builder feedback on budget UX.

NEXT 6 WEEKS

Expand tool catalog / MCP on the same vault · mainnet when ops are ready.
